

Mohammad Atiqul Islam

Dept. of Computer Science and Engineering
The University of Texas at Arlington,
500 UTA Blvd, Arlington, TX 76019

Email: mislam@uta.edu
Ph: +1 (225) 573 6910
Website: crystal.uta.edu/~mislam

HIGHLIGHTS

Tier-1 Conference Publications: SenSys'23, HPCA'23, HPDC'22, HPCA'21, SIGMETRICS'20, SIGMETRICS'18, CCS'18, HPCA'18, CCS'17, HPCA'16, HPCA'15, and ICCAD'15.

Research Grants: Total \$1010K as PI. \$700K from US National Science Foundation ECCS and CCF (2022-2026), \$300K from the University of Texas System Rising STARS (2019 - 2022), \$10K from UTA Research Enhancement Program (2021-2022).

Services: Program committee member USENIX Security'21, HPCA'22, CCS'22, SC'22, CCS'23

RESEARCH AREAS

Cloud and distributed systems: performance, scheduling and resource allocation, energy efficiency, load balancing

Security and resilience: side-channels, power attacks, thermal attacks, handling overloads

Economics and computing: market design, auction and bidding, coordination through markets

Cyber-physical systems: data center power and cooling, thermal aware management, carbon-water efficiency

Privacy-preserving machine learning: efficient federated learning, fair federated learning, self-regulating clients

EMPLOYMENT

2019 - current	Assistant Professor , Computer Science and Engineering, University of Texas at Arlington
2008 - 2012	Specialist , Core Network Planning, Robi Axiata Ltd., Bangladesh

EDUCATION

2018	Ph.D. in Electrical and Computer Engineering University of California, Riverside
2008	B.Sc. in Electrical and Electronics Engineering Bangladesh University of Engineering and Technology

RESEARCH GRANTS

2023 - 2026	NSF CCF#2324915 , Amount: \$300K (PI) Collaborative Research: DESC: Type I: A User-Interactive Approach to Water Management for Sustainable Data Centers: From Water Efficiency to Self-Sufficiency
2022 - 2025	NSF ECCS#2152357 , Amount: \$400K (PI) Utilizing Conducted Electromagnetic Interference (EMI) for Low-Cost Server-Level Power Monitoring in Data Centers
2021 - 2022	UTA Research Enhancement Program (REP) , Amount: \$10K (PI) Ultra-Low-Cost Server-Level Power Monitoring in Data Centers
2019 - 2022	UT Systems Rising STARS , Amount: \$300K (PI)

PROFESSIONAL SERVICE

2021 - present	Program Committee Member , USENIX Security'21, HPCA'22, CCS'22, CCS'23, SC'22, NSysS'20, ICCCI'22
2028 - present	Journal Reviewer , TPDS, TCC, TDSC, TGCN, TSUSC, TON, TSC, ACM Computing Surveys, TOMPECS, TOSN

OUTREACH

2022 - present	Faculty mentor UTA LSAMP - Summer Research Academy and UTA I-Engage Mentoring Program
2020 - present	Member of Outreach and Student Recruitment Committee Computer Science and Engineering at the University of Texas at Arlington
2020 - present	Member of External and BPC Student Award Committee Computer Science and Engineering at the University of Texas at Arlington

ADVISING AND MENTORING

2019 - present	Student advising: Md Rajib Hossen (PhD), Pranjol Sen Gupta (PhD), Zahidur Rahim Talukder (PhD), Tasnim Azad Abir (PhD), Mohammad Shahedur Rahman (PhD), Sahar Zargarzadeh (PhD), Iftakhar Ahmad (MS)
2015 - 2018	Student mentoring: Zhihui Shao (PhD), Fangfang Yang (PhD), Ji Guo (MS), Christian Adrito (BS), Aaron Sanders (BS), Jerry Huang (High school)
2016 and 2017	Judge and mentor for K-12 students Science Fair Expo at the Riverside County Office of Education

ONGOING RESEARCH PROJECTS

- 1) Practical Efficient Microservice Management (Research Areas: Cloud, Distributed Systems):** We are developing a lightweight and efficient microservice resource manager that, unlike existing ML-based approaches, neither needs extensive training nor causes any intentional SLO violations. Moreover, Our feedback-based approach does not require training, allowing it to adapt quickly to microservices' dynamic operating environments. [Related papers: *HPDC'22, SIGMETRICS'22 poster, Cloud Computing'22*]
- 2) User-in-the-Loop Management (Research Areas: Economics of Computing, Cloud, HPC):** We are developing a novel market-based resource control where the users actively participate in HPC management. Our highly scalable approach alleviates the HPC manager's burden of power-aware job scheduling for oversubscribed HPC systems. [Related papers: *HPCA'23, HPCA'18, HPCA'16, HPCA'15*]
- 3) Efficient Federated Learning (Research Areas: Security and Privacy, Edge Computing):** We are developing novel algorithms to efficiently address the data heterogeneity problem in Federated Learning (FL). We propose computation efficient methods to auto-generate aggregation weights for the central model server. On the client side, we are developing lightweight checkpoints to decide early exit from participating in FL model updates and saving clients' computation and communication costs. [Related papers: *IEEE Edge'22, SIGMETRICS'22 poster*]
- 4) Novel Monitoring for Data Center Reliability (Research Areas: Security, Cyber-Physical Systems, Sensors):** We are developing an acoustic sensing-based system using microphone arrays to measure a server's "true" power consumption from its cooling fan noise. Our system will be able to mitigate the threat of behind-the-meter heat injection attacks from servers with integrated batteries. [Related papers: *HPCA'21, SIGMETRICS'18, CCS'17*]
- 5) Server-Level Power Monitoring in Data Centers (Research Areas: Cyber-Physical Systems, Sensors):** We are developing the first-of-its-kind ultra-low-cost server-level power monitoring in data centers that extracts server power usage information from the conducted electromagnetic interference (EMI) generated by server power supplies. Our approach will significantly lower the data center's instrumentation cost by eliminating the need for dedicated power meters for each server. Instead, we use a single sensor's voltage measurement from a single point to provide server-level power consumption. This project is funded by NSF under the three-year \$400K grant ECCS#2152357. [Related papers: *SenSys'23, SIGMETRICS'20, CCS'18*]
- 6) Monitoring Behind-the-Meter Distributed Energy Resources (Research Areas: Sensors, IoT):** We are developing a novel voltage probing and analysis prototype that captures high frequency (10kHz~100kHz) conducted electromagnetic interference (EMI) signatures from grid-tied inverters enabling utilities to identify the presence and operational status of behind-the-meter distributed energy resources (DERs) such as solar. Our approach breaks significant barriers in situational awareness of customer-side BTM DERs. We do not rely on any historical patterns/characteristics; instead, we directly monitor the DER inverter's real-time generation. We can identify battery-coupled DER systems. We enable a non-intrusive utility-side and fully utility-managed BTM DER monitoring system. [Related papers: *SenSys'23, SIGMETRICS'20, CCS'18*]
